P and Q coincide, L OTN L OPN, and NN becomes the tangent to the locus of N; hence the latter tangent makes the same angle with ON that the tangent at P makes with OP. This property enables us to draw the tangent at any point N on the pedal locus in question. Again, if p represent the perpendicular on the tangent at N to the first pedal, from similar triangles we evidently have y Hence if the equation of a curve be given in the form  $r = f(p)$ , that of its first pedal is of the form  $r = f(p)$ , m which p and p are respectively analogous to r and p in the original curve. In like manner the equation of the next pedal can be determined, and so on. 185. Reciprocal Polars. --If on the perpendicular ON a point P be taken, such that...
