Some four years back there appeared in Punch a picture somewhat of the Corsican Brothers order. This picture, as far as I remember it, consisted of a lady sitting in her drawing room in England, and looking at the part of the room where one would expect to see the wall, but where instead she sees projected into space her daughters playing lawn-tennis in India. Pundit, no doubt, regarded this picture as a sort of philosophers dream; but it at once occurred to my colleague, Professor Perry, and myself, then in Japan, that we really had the means in our power of realising this dream. For, when a galvanic battery sends an electric current through a piece of selenium, the current, as was discovered by Mr. Willoughby Smith in 1873, is increased by allowing light to fall on the selenium, and the greater the intensity of the light the greater is the increase of current. This phenomenon is popularly attributed to a diminution of resistance of the selenium by light, but as Mr. Perry and myself have explained to the Physical Society, we have reasons for thinking that this curious effect may, perhaps, be due simply to a direct conversion of light energy into electric energy. However, be that as it may, I will now show you experimentally how Professor Perry and myself propose employing this property of selenium to enable us to See by Electricity. Suppose we in London...
